#### **Volcano Plot**

```
plot( res$log2FoldChange, -log(res$padj) )
```

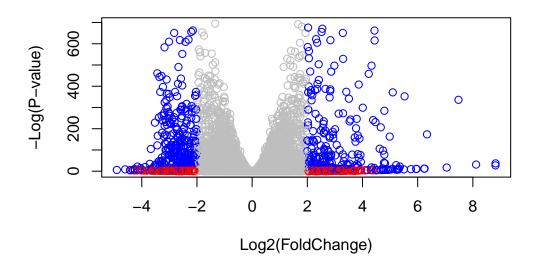

#### Q4. Improve this plot by completing the below code, which adds color and axis labels

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(</pre>
```

#### Adding gene annotation

Q5. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENE-NAME annotation to our results by completing the code below.

```
library("AnnotationDbi")
  library("org.Hs.eg.db")
  columns(org.Hs.eg.db)
 [1] "ACCNUM"
                    "ALIAS"
                                   "ENSEMBL"
                                                   "ENSEMBLPROT"
                                                                  "ENSEMBLTRANS"
 [6] "ENTREZID"
                    "ENZYME"
                                   "EVIDENCE"
                                                   "EVIDENCEALL"
                                                                  "GENENAME"
[11] "GENETYPE"
                    "GO"
                                                   "IPI"
                                   "GOALL"
                                                                  "MAP"
[16] "OMIM"
                    "ONTOLOGY"
                                   "ONTOLOGYALL" "PATH"
                                                                  "PFAM"
[21] "PMID"

## Q6. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

#### Section 2. Pathway Analysis

#### **KEGG Pathways**

```
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG license agreement (details at http://www.kegg.jp/kegg/legal.html).

```
library(gage)
```

```
library(gageData)

# Q8: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The "Cell Cycle, Mitotic" has the most significant "Entities p-value". While my previous KEGG results include DNA Replication, Nucleocytoplasmic Transport, Homologous Recombination, etc., the Reactome Analysis' most significant pathways include Cell Cycle (Mitotic), Cell Cycle, Mitotic Spindle Checkpoint, Amplification of signal from unattached kinetochores via a MAD2 inhibitory signal, etc. These differences could be caused by the database content. These are two different databases, which suggests that some pathways or genes may be more unique to one database than the other. These differences could also be caused by the statistical algorithms each database may possess. KEGG and Reactome could employ different statistical approaches to their data which could lead to variances in p-values and significance levels.
